

18. In the figure below a horizontal force F_a of magnitude 20N is applied to a 3kg psychology book, as the book slides a distance of d=0.5m up a frictionless ramp. (a) During the displacement, what is the net work done on the book by F_a , the gravitational force on the book and the normal force on the book? (b) If the book has zero kinetic energy at the start of the displacement, what is the speed at the end of the displacement?

$$N \perp d \rightarrow W = 0$$

Only F_{gx} , $F_{ax} do work$
(a) $W = W_{Fax} - W_{Fgx}$ or $W_{net} = \vec{F}_{net} \cdot \vec{d}$
 $F_{net} = Fa_x - Fg_x = 20\cos 30^\circ - mg\sin 30^\circ$
 $W_{net} = (17.32N - 14.7N)0.5m = 1.31J$
(b) $K_0 = 0 \rightarrow W = \Delta K = K_f$
 $W = 1.31J = 0.5mv_f^2 \rightarrow v_f = 0.93m/s$

55. A 2kg lunchbox is sent sliding over a frictionless surface, in the positive direction of an x axis along the surface. Beginning at t=0, a steady wind pushes on the lunchbox in the negative direction of x, Fig. below. Estimate the kinetic energy of the lunchbox at (a) t=1s, (b) t=5s. (c) How much work does the force from the wind do on the lunch box from t=1s to t=5s?

74. (a) Find the work done on the particle by the force represented in the graph below as the particle moves from x=1 to x=3m. (b) The curve is given by $F=a/x^2$, with $a=9Nm^2$. Calculate the work using integration

73. An elevator has a mass of 4500kg and can carry a maximum load of 1800kg. If the cab is moving upward at full load at 3.8m/s, what power is required of the force moving the cab to maintain that speed?

A single force acts on a body that moves along an x-axis. The figure below shows the velocity component versus time for the body. For each of the intervals AB, BC, CD, and DE, give the sign (plus or minus) of the work done by the force, or state that the work is zero.

$$W = \Delta K = K_f - K_0 = \frac{1}{2}m(v_f^2 - v_0^2)$$

$$AB \rightarrow v_B > v_A \rightarrow W > 0$$

$$BC \rightarrow v_C = v_B \rightarrow W = 0$$

$$CD \rightarrow v_D < v_C \rightarrow W < 0$$

$$DE \rightarrow v_E < 0, v_D = 0 \rightarrow W > 0$$

50. A 250g block is dropped onto a relaxed vertical spring that has a spring constant of k=2.5N/cm. The block becomes attached to the spring and compresses the spring 12 cm before momentarily stopping. While the spring is being compressed, what work is done on the block by (a) the gravitational force on it and (b) the spring force? (c) What is the speed of the block just before it hits the spring? (Friction negligible) (d) If the speed at impact is doubled, what is the maximum compression of the spring?

(a)
$$W_{Fg} = \vec{F}_g \vec{d} = mgd = (0.25kg)(9.8m/s^2)(0.12m) = 0.29J$$

(b) $W_s = -\frac{1}{2}kd^2 = -0.5 \cdot (250N/m)(0.12m)^2 = -1.8J$
(c) $W_{net} = \Delta K = 0.5mv_f^2 - 0.5mv_i^2$
 $v_f = 0 \rightarrow K_f = 0 \rightarrow \Delta K = -K_i = -0.5mv_i^2 = W_{Fg} + W_s$
 $0.29J - 1.8J = -0.5 \cdot (0.25kg)v_i^2$
 $\rightarrow v_i = 3.47m/s$
(d) If $v_i' = 6.95m/s \rightarrow Maximum spring compression? $v_f = 0$
 $W_{net} = mgd' - 0.5kd'^2 = \Delta K = -0.5mv_i'^2$
 $d' = 0.23m$$

62. In the figure below, a cord runs around two massless, frictionless pulleys; a canister with mass m=20kg hangs from one pulley; and you exert a force F on the free end of the cord. (a) What must be the magnitude of F if you are to lift the canister at a constant speed? (b) To lift the canister by 2cm, how far must you pull the free end of the cord? During that lift, what is the work done on the canister by (c) your force (via the cord) and (d) the gravitational force on the canister?
