

$v_1 = 30.0 \text{ km/hr W}$	$v_2 = 40.0 \text{ km NW}$
$\Delta t_1 = 4 \text{ hrs}$	$\Delta t_2 = 2 \text{ hrs}$

make Grand Bahama Island the origin of our coordinate system with East being the + x direction and North being the + y direction (see diagram below). Use constant velocity motion and addition of vectors

### Problem 5 (20 points)

Several years ago, at 8 AM the eye of hurricane Floyd passed over Grand Bahama Island heading due west at a speed of 30.0 km/h. Four hours later, the course of hurricane Floyd shifted to Northwest towards the Florida coast and its speed increased to 40.0 km/h. Floyd continued on this course at this speed for two hours before turning due north again.

A. How far from Grand Bahama was hurricane Floyd 6 hours after it passes over the island?

The hurricane makes two constant velocity motions:

$\Delta \vec{r}_1$  from going West at 30.0 km/hr for 4 hrs &

$\Delta \vec{r}_2$  from going NW at 40.0 km/hr for 2 hrs

The hurricane's displacement  $\Delta \vec{r} = \Delta \vec{r}_1 + \Delta \vec{r}_2$

$\Delta \vec{r} = |\Delta \vec{r}_1|(-\cos \phi \hat{i} + \sin \phi \hat{j}) + |\Delta \vec{r}_2|(-\cos \alpha \hat{i} + \sin \alpha \hat{j})$  where

$\phi = 0^\circ$  is the angle between  $\Delta \vec{r}_1$  & the -x axis,  $\alpha = 45^\circ$  is the angle between  $\Delta \vec{r}_2$  and the -x axis,

$|\Delta \vec{r}_1| = v_1 \Delta t_1 = (30.0 \text{ km/hr})(4 \text{ hrs}) = 120 \text{ km}$        $|\Delta \vec{r}_2| = v_2 \Delta t_2 = (40.0 \text{ km/hr})(2 \text{ h}) = 80 \text{ km}$

$\Delta \vec{r} = (-|\Delta \vec{r}_1| \cos \phi \hat{i} + 0 \hat{j}) + (-|\Delta \vec{r}_2| \cos \alpha \hat{i} + |\Delta \vec{r}_2| \sin \alpha \hat{j}) = (-|\Delta \vec{r}_1| \cos \phi - |\Delta \vec{r}_2| \cos \alpha) \hat{i} + |\Delta \vec{r}_2| \sin \alpha \hat{j}$

$\Delta \vec{r} = [-(120 \text{ km}) \cos 0^\circ - 80 \text{ km} \cos 45^\circ] \hat{i} + 80 \text{ km} \sin 45^\circ \hat{j} = -176.6 \text{ km} \hat{i} + 56.57 \text{ km} \hat{j}$

$|\Delta \vec{r}| = \sqrt{(-176.6 \text{ km})^2 + (56.57 \text{ km})^2} = 185 \text{ km} (185.4 \text{ km})$

B. What was Floyd's average speed during this time?

Average Speed = distance / time =  $(d_1 + d_2) / (Dt_1 + Dt_2) = (120 \text{ km} + 80 \text{ km}) / (4 \text{ hrs} + 2 \text{ hrs})$

Average Speed =  $200 \text{ km} / 6 \text{ hrs} = 33.3 \text{ km} / \text{hr}$

C. What was Floyd's average velocity during this time?

Average velocity  $\langle \vec{v} \rangle = \text{displacement} / \text{time} = \Delta \vec{r} / \Delta t$

$|\langle \vec{v} \rangle| = |\Delta \vec{r} / \Delta t| = |\Delta \vec{r}| / (\Delta t_1 + \Delta t_2) = (185.4 \text{ km}) / (4 \text{ hrs} + 2 \text{ hrs}) = 30.9 \text{ km} / \text{hr}$

direction:  $\vartheta = \arctan \left( \frac{|\Delta \vec{r}_y|}{|\Delta \vec{r}_x|} \right) = \arctan \left( \frac{56.56 \text{ km}}{176.6 \text{ km}} \right) = 17.8^\circ$

alternatively,  $\langle \vec{v} \rangle = \Delta \vec{r} / \Delta t = (-176.6 \text{ km} \hat{i} + 56.57 \text{ km} \hat{j}) / (4 \text{ hrs} + 2 \text{ hrs}) = -29.4 \text{ km} \hat{i} + 9.43 \text{ km} \hat{j}$

D. Sketch a vector representing hurricane Floyd's average acceleration during this time.

Since Delta v is proportional to the average acceleration, Delta v vector points in the direction of the acceleration. Recall that  $\vec{a} = \Delta \vec{v} / \Delta t = (\vec{v}_f - \vec{v}_i) / \Delta t$
